EXPERIENCES

NASA Jet Propulsion Laboratory

San Jose, CA

Software Engineering Intern | Year-round Internship Program

September 2025 - Present

- Designed and implemented SHARAD radargram picker software in Python and C++ to ingest, process, and analyze 37,000+ radar observations
- Created a SQLite database from scratch to manage metadata, orbit indexing, and analysis outputs, enabling scalable and structured access for large datasets
- Built and optimized data ingestion, feature extraction, and transformation pipelines, integrating SQL queries for efficient data management and reproducibility
- Collaborate with cross-functional engineering teams using Git version control on spacecraft mission planning systems, contributing to distributed software architecture supporting deep space operations

Lawrence Berkeley National Laboratory

Berkeley, CA

Student Researcher - Software

November 2025 - Present

- Develop a design systems using TypeScript, JavaScript, and React, building modular component library with npm packaging and Storybook documentation for distributed development workflows
- Identified system bottlenecks, applied data-driven improvements, and documented workflows to support cross-disciplinary team coordination
- Create reusable software components across 70+ React modules, shipping iterative improvements to distributed systems supporting multi-user research workflows
- Implement component testing and documentation infrastructure using Storybook, enabling rapid prototyping and validation of UI components

NASA Jet Propulsion Laboratory

Pasadena, CA

Software Engineering Intern | NASA Europa Clipper ICONS Internship

June 2025 - September 2025

- Built a Jovian radio burst prediction system using processed spacecraft ephemeris data to forecast radio emissions from Jupiter and Io interactions
- Designed Python and Java pipelines to process 104 GB of ephemeris and observational datasets using the NASA SPICE Toolkit, enabling structured data extraction for predictive modeling
- Refactored legacy Python and Java code to improve performance, scalability, and system reliability for end-to-end mission data processing
- Developed automated validation scripts and simulation-based tests to evaluate prediction accuracy and reproducibility

PROJECTS

ResumAI | Python, Streamlit, scikit-learn, natural language processing, SentenceTransformer

- Built full-stack ML application with 85% accuracy using transformer-based embeddings, implementing end-to-end data pipeline with Python systems programming
- Designed NLP processing pipeline with text extraction, normalization, and vector-space analysis, demonstrating proficiency in distributed data processing workflows
- Created 3D visualization system to represent semantic relationships, building infrastructure for interactive simulation environments

EDUCATION

San José State University (Admitted – Fall 2026) | B.S. in Computer Science

De Anza College - June 2026 | AS-T in Computer Science, June 2025. AS-T in Mathematics, June 2026

Relevant courses: Data Structure and Algorithms, Multivariable Calculus, Electromagnetism, Modern Physics, Thermodynamics, Discrete Mathematics, Python Programming, C++ Programming, Circuit Analysis.

SKILLS AND INTERESTS

- **Technical:** Python (strong proficiency, object-oriented programming), C/C++, Java, JavaScript, HTML/CSS, FastAPI, Streamlit, Git/Version Control, NASA SPICE Library, SQLite, Machine Learning, Predictive Modeling
